

## Putting Services at the heart of Government

Government agencies and departments world-wide have proven to be amongst the largest adopters of services-oriented architectures that are truly customer-centric. They use XML to link their systems together, and to expose "Government Gateways" for private citizens, businesses and internal government departments and agencies to access government portals that expose a wide range of services. Adopting a services-oriented approach at the heart of the IT architectural policy is central to the success of eGovernment initiatives that allow for the quick and seamless exchange of critical information.

## Right service, at the right time, to the right person

Vordel ensures consumers of Government services users are afforded an efficient, anytime, anywhere availability that maintains security and protects the privacy of their personal information. Homeland Security mandates for a heightened regulatory environment means government agencies need to actively protect and control the release of private and sensitive information.

Furthermore, when delivering services, these government agencies are also obliged to collect, accumulate, process and share information whilst at the same time Data Privacy legislation demands governments can simultaneously assure individual privacy. Vordel provides the secure cross-domain exchange infrastructure to ensure compliance with all internal governance controls and external regulatory mandates.

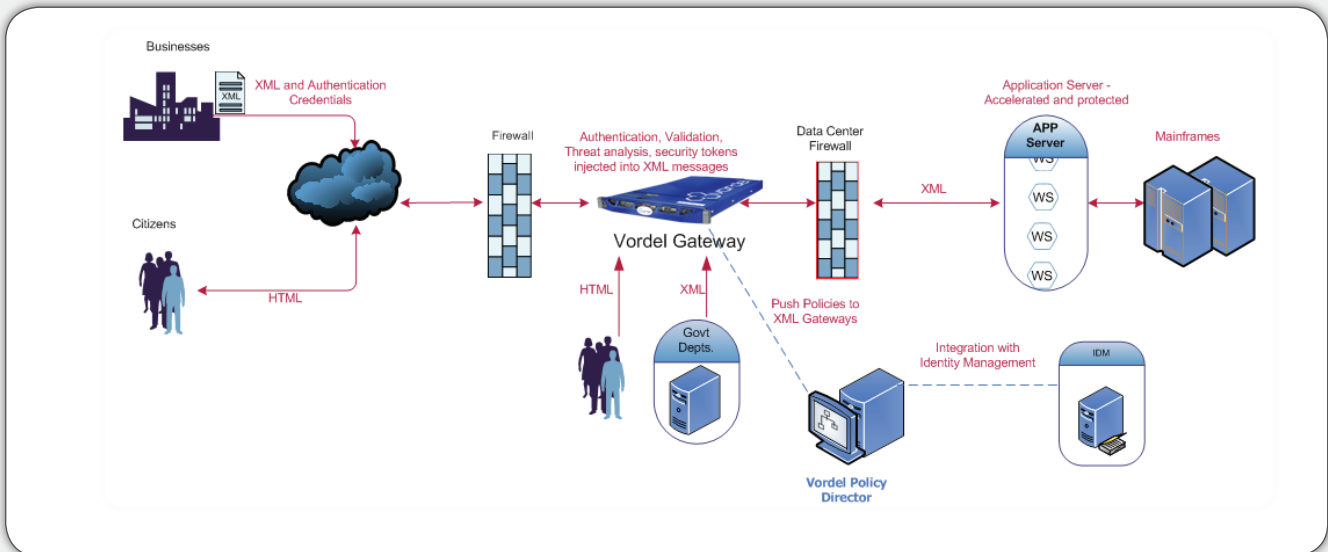

## Sample Customers

## Relevant Certifications & Standards

- FIPS 140-2 Level 2 (EAL 4)

## How it all Works

## Why Choose Vordel

Vordel is responding to the needs of Government Departments and Agencies world-wide.

### Fast, efficient deployment

- Flexible deployment options - on premise appliance, software, VMware, or as cloud-based instance
- Pre-built connectors for all IdM, security, messaging and network management systems
- Accelerate processor intensive XML processing tasks with Vordel's performance optimized core pipeline engine

### Safe

- Identity Controls based on existing and new user profiles
- Privacy controls provide encryption and signing at field level which allows sensitive information to be selectively encrypted and signed
- Audit Logging for a complete audit trail maintained of all transactions
- Security throughout transaction life-cycle
- High level of security certification

### Reliable

- Deployed in a high-availability environment, with no single-point-of-failure
- Avoid vendor lock-in and future proof your eGovernment solution through Vordel's support of open standards
- Enforce SLAs with suppliers, partners and customers
