

Streamline and secure communications between insurance agents, insurers, and banks

SOA is enjoying widespread adoption by the insurance industry as insurers leverage the XML standards-based approach of initiatives such as ACORD to smooth and streamline the delivery of products and services across their many IT systems and channel intermediaries. Vordel is widely deployed within the insurance industry to enable insurers adopt a SOA approach to their IT operations, confident in the knowledge that they are compliant with regulations and are not compromising on security.

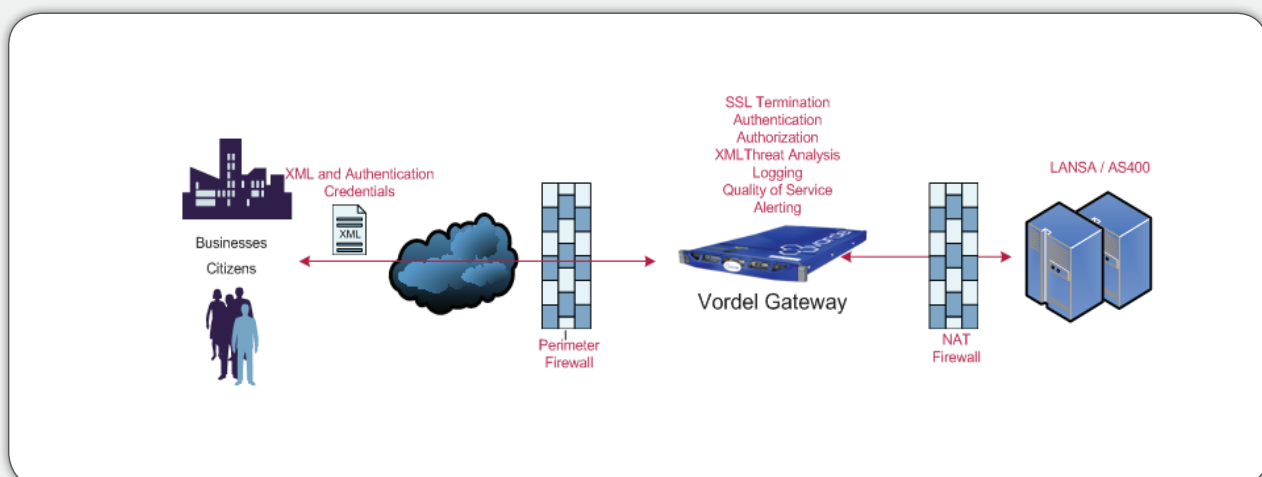

Services centric insurance with Low Latency and high performance

Vordel allows insurers to connect their back-office systems and services to intermediary banks and insurance agents in a fast and secure manner. By securely automating direct system-to-system integration, insurers can extract added value from their Services Oriented Architecture.

By logging and archiving all Web Services-based transactions, Vordel's products enable compliance with the retention and privacy requirements and corporate governance policies of regulatory bodies (including HIPAA, Sarbanes-Oxley). Vordel's management controls for auditing and non-repudiation ensure message integrity and the enforcement of Service Level Agreements.

The patented core VXA acceleration engine processes XML security primitives at high speed, ensuring that the processing of XML is optimized once offloaded from application servers and placed onto the Vordel product infrastructure.

How it Works

- Sarbanes Oxley
- HIPAA
- FIPS

Why Choose Vordel

Reduced costs and faster time to market to existing and new markets – Vordel provides flexibility to update security policies centrally; implement upgrades without hard coding and without firmware upgrades, and can easily scale the application of security to new partners and customers as and when required.

Scale your SOA deployment quickly without extra costs – Vordel accelerates processor intensive XML processing tasks via its performance optimized core VXA pipeline engine. Offload the heavy lifting to Vordel and save on redundant additional software licenses.

Safe

Re-use existing security infrastructure obtaining return on assets – avoid the cost and extra management complexity of new “silos” of users and policies.

Comply with Financial Services regulatory guidelines for auditing and non-repudiation – the use of strong authentication and authorization, as well as maintenance of an audit trail of all transactions, satisfies regulatory requirements.

Connected

Connectors reduce software development costs – With Vordel, insurers put control of XML onto the network, into the hands of operations staff, rather than developers. This means that the need to maintain and support custom developed code is no longer an administration headache.

Drag-and-Join Integration – A drag-and-join interface allows users to create links between applications as diverse as TIBCO EMS, CA SiteMinder, Amazon Web Services, and Microsoft .NET, among others. This allows enterprises to avoid heavy integration costs and generates a higher rate of ROI on their existing infrastructures.
